

IMPACT OF SEASONAL CHANGES ON AVIFAUNA DIVERSITY IN NGURU WETLAND,  
YOBESTATE, NIGERIA.

ABSTRACT

The research on impact of seasonal changes on avifauna diversity in Nguru Lake of Hadejia-Nguru Wetland was carried out in two different seasons for the period of six months, from April to June (dry season) and July to September (wet season). The aim was to evaluate the impact of seasonal changes on avifauna diversity and the species richness in the study area. A reconnaissance survey was carried out to select study sites and sampling points. Five (5) different points were selected which comprises of Madauka, Kayayashi, Farin Ruwa, Badum respectively and Point count census techniques were adopted. In each counting station, bird observation was carried out twice daily; morning between 6:00 am and 10:00 am and evening between 4:00 pm and 6:00 pm. Data compilation was done using Microsoft Excel and were analysed using statistical software Past 326b. Bird diversity was calculated using Shanon-Weiner diversity index. The finding of this research showed that the majority of bird species identified were Resident (12,225), Migratory (8,186) and Palearctic Migrant (10,876) species in the study area. Dominant bird species in Nguru lake were *Philomachus pugnax*, *Actophilornis africanus* and *Phalacrocorax africanus*. A total of 5,538 birds' species was identified (Dry Season) in Nguru lake "belonging to 21 families in which Ardeidae have the highest (7) species of bird. Shannon Diversity Index has 2.55 in dry season, while in Wet Season has 3.40. This indicated that there was relatively equal and high diversity of bird species in Wet Season in the study area and has the total species richness of 6,711. Overgrazing and other anthropogenic activities which affect the population diversity of avifauna species serve as major threats to the continued existence of Wetlands. *Typha* grass also remained pressing problem which creates microhabitats reducing critical habitat for feeding, nesting and roosting habitat for birds, as well as hamper smooth flow of water used by many water bird species. In view of the findings of this study, effective monitoring and strategies for conservation to restore the population of bird species, provide public enlightenment of the people around the wetland and management of Hadejia-Nguru Wetland promptly advice the significant importance of the wetland in serving as home for resident and migratory bird

species.

Key Words: Impact, Seasonal Changes, Avifauna, Diversity, Reconnaissance, Survey, Sampling.

## INTRODUCTION

Avifauna is a general name for bird species. Birds are feathered, winged, egg-laying vertebrates. They belong to the Kingdom "Animalia," Phylum "Chordata" and Class "Aves". They have a worldwide distribution, living in and around oceans, rivers, forests and mountains. They are the most noticeable group in the animal kingdom. Their bright colours, distinct songs and calls, and showy displays add fun to human life. Many people derive great pleasure from watching birds and listening to their beautiful songs. Birds are social animals that communicate with visual signs, calls and songs. They display social behaviour such as cooperative breeding and hunting, flocking and mobbing of predators. Birds live and breed in most terrestrial habitats and on all the seven continents. Nigeria is blessed with many species of birds scattered throughout the different ecological regions. As with any natural habitat, wetlands are important in supporting bird species diversity. Wetlands provide food for birds in the form of plants, vertebrates, and invertebrates. Some birds forage for food in the wetland soils, while some find food in the water column and others feed on the vertebrates and invertebrates that live on submerged and emergent plants. (Labe et al., 2018).

Studies on bird diversity by Burgess et al. (2002), Doggart et al. (2005), Frontier-Tanzania (2005), and Yanda and Munishi (2007) in the Uluguru area were confined to the forest emphasis in the general negative effects of forest conversion to human dominated habitats. Nevertheless, human dominated and agricultural habitats vary a lot and therefore the effect on birds can be very different (Tworek, 2002). Responses of birds to habitat changes differ depending on their strategies, some lifestyles benefit from habitat change, while for others it is a principal threat (Tworek, 2002). Birds are

very visible and integral part of the ecosystem that occupy many trophic levels in a food chain ranging from consumers to predators. Their occurrences have been helpful as environmental health indicator, plant pollinators and seed dispersals as well as pest controller (Hadley et al., 2012; Ramchandra, 2013). This research work identified avifauna species and determine its diversity in the study area.

## MATERIALS AND METHOD

### Study Area

This research was carried out at Hadejia-Nguru Wetlands (HNWs) located in the Sahelian Zone of Nigeria at a point where River Hadejia and flow through a fossil dune field before converging and draining into Lake Chad. It lies between latitude  $12^{\circ}13'N$  to  $12^{\circ}55'N$  and longitude  $10^{\circ}15'E$  to  $11^{\circ}30'E$  (Ayeni et al., 2019), covering three Nigerian states namely; Bauchi, Jigawa and Yobe (Figure 1). The Hadejia-Nguru Wetlands named after two major towns (Hadejia and Nguru) are extensive floodplain wetlands in the dry lands of northern Nigeria which are surrounded by many villages. It supports a wide range of biodiversity and livelihood activities. (Ayeni et al., 2019).

The wetlands extend for approximately 120 km from west to east within Jigawa State and for a further 60-70 km down-stream in adjacent Yobe State (Caro et al., 2011). In width, the wetlands range from 10 km to more than 50 km from north to south, with approximately  $8000 \text{ km}^2$  of floodplain. The extent of the floodplain varies considerably from year to year depending on rainfall and complex interactions of riverflow, dam releases, flood regimes and topography. (Bourn, 2003).

#### Research Design

A reconnaissance survey was carried out with the aid of topographic map and

personnel assistant to select study sites and sampling points in the field after obtaining permission from the authorities of Nguru Wetland. The survey was carried out at study area and five (5) points were been selected namely; Madauka, Kayayashi, Farin Ruwa, Badum and Guzan lakes respectively. The survey was carried out for the period of six (6) months (three months for dry season and three months for wet season. Birds' observation was carried out once in a month. Birds were counted as birds seen and heard around the area and birds in flight were also counted within 100 meters radius to aid data collection. A pair of binoculars with magnification 988,000m Model 750 was used for birds viewing alongside with field guide book "Birds of Western Africa" by Borrow and Demey (2014) for identification of birds (Ramsar Convention Bureau, 2000). A Komery Digital Camera 24 MP was also used for taking photographs of birds.

#### Method of Data Collection

Point count census techniques as outlined by Bibby et al. (1992) and Ralph et al. (1993) were adapted to count the birds for the study. Five (5) different points were selected randomly from each study sites, namely; Madauka, Kayayashi, Farin Ruwa, Badum and Guzan.

In each counting station, bird observation was carried out twice daily; morning between 6:00 am and 10:00 am and evening between 4:00 pm and 6:00 pm. On arrival at each counting station, the observers stayed for five (5) minutes before beginning to count. This was to enable the birds to settle down following disturbance by the arrival of the observers. The observers at each counting point recorded the entire birds encountered for a period often (10) minutes with the aid of binoculars alongside with field guide book "Birds of Western Africa" by Borrow and Demey (2014). Data forms were restructured for ease of recording all the information.

#### Data Analysis

Compilation and analysis of data was done using Microsoft Excel (2013 version). Data were analysed using statistical software Past 326b.

i. Table was used to present the types of avifauna species identified in the study area

forrainyseasonanddryseasonaccordingtoLammeed(2011).

ii. AvifaunaspeciesdiversitywascalculatedusingShannon-Weinerdiversityindex,H:

$$H = - \sum_{i=1}^S p_i \ln p_i$$

Where:

H=Shannon-WeinerDiversityIndex

S=Totalnumberofspeciesofthecommunity(numberseenandheard).

Pi=Proportionofeachorindividual(1<sup>th</sup>)speciesintheSample.

1nPi=NaturalLogarithm ofthespeciesproportion.(Lammeed,2011).

## RESULTS

### AvifaunaSpeciesIdentifiedinNguruWetland(NGW)inDrySeason

The result of the avifauna species identified in 'NGW' for the 1<sup>st</sup>, 2<sup>nd</sup> and 3<sup>rd</sup> visits are presented in Table 1. The table showed that 2,148 bird species were identified in the first visit, 1,658 bird species were identified in the second visit and 1,732 species were identified in the third visit (Total=5,538) belonging to 21 different families in dry season in the study area. The families of Bucerotidae, Coraciidae, Cuculidae, Motacillidae, Phalacrocoracidae, Ploceidae, Psittacidae, Pyconotidae, Recurvirostridae, Scolopacidae, Sternidae, Sturnidae and Viduidae contained 1 species each, families of Accipitridae, Alcedinidae, Charadriidae and Jacanidae contained 2 species each, family of Anatidae contained 3 species, while families of Columbidae and Rallidae contained 4 species and Ardeidae contained the highest number of 7 species in the study area.

### AvifaunaSpeciesIdentifiedinNguruWetland(NGW)inWetSeason

The result of the avifauna species identified in the study area for the 1<sup>st</sup>, 2<sup>nd</sup> and 3<sup>rd</sup> visits are presented in Table 2. The table shows that 690, 281 and 202 bird species (Total =1,173) were identified in the first, second and third visits respectively during rainy season, different families in the study area. The families of Bucerotidae,

Coraciidae, Cuculidae, Motacillidae, Phalacrocoracidae, Ploceidae, Psittacidae, Pyconotidae, Recurvirostridae, Scolopacidae, Sternidae, Sturnidae and Viduidae contained a single bird species each, meanwhile the families of Accipitridae, Alcedinidae, Charadriidae and Jacanidae contained 4 bird species each where only Anatidae family contained 3 species of birds, the families of Columbidae and Rallidae contained 4 bird species while Ardeidae contained 7 different bird species in the study area during wet season.

## Avifauna Species Diversity in the Research Area

The result of avifauna species diversity of Nguru Wetland during dry season is shown in Table 3.

The result indicated that the Shannon Diversity Index was 2.548 for total individual species in the study area with *Philomacuspugnax*(0.34258) having the highest diversity and *Egrettaintermedia*(0.00156) being the lowest diversity.

The result of avifauna species diversity of Nguru Wetland, Wet Season is shown in Table 4. The result indicated that Shannon Diversity Index was 3.40307 for total individual species in the study area with *Actophilonisaficanus*(0.2136) having the highest diversity while *Circusranivorus*(0.01087), *Egrettaintermedia* and *Nettapusauritus*(0.01527) respectively having the lowest diversity.

## DISCUSSION

The finding of this study shows that the majority of bird species identified during the research were Resident (12,225), Migratory (8,186) and Palearctic Migrant (10,876) species in the study area. Some of the resident species recorded include, African Jacana, Longtail/Reed Cormorant, African Mourning Dove, Vinaceous Dove, Pied Kingfisher, Common Moorhen; Migratory birds include, Yellow Wagtail, African Marsh Harrier, Intermediate Egret, Red-billed Hornbill, Garganey; and the Palearctic migrant bird species were White-faced Whistling Duck, Squacco Heron, Fulvous Whistling Duck, Yellow Billed Kite and Green Sandpiper. According to Osunsina et al. (2018) the majority of birds observed during the study were residents species, migratory and Palearctic migrants species. Similar observation was made by Sabo, (2016). This shows that bird species found are either residents, intra-migrants, Vagrant and Palearctic Migrant. Also Lameed, (2011) in his study, showed that the majority of wetland birds observed were Resident, Migratory and Palearctic species. The finding of this study could be established that the most dominant bird species in Nguru Lake were Philomachus pugnax (1,330), Actophilornis africanus (904), Phalacrocorax africanus (719), Col umba guinea (79).

The findings of the study on diversity of avifauna species in Nguru Wetland

shows that the Shannon Diversity Index for the area was 2.55 in Dry Season, while that of Wet Season in the area has 3.40. The results are indicative of relative high diversity of bird species in the Wet Season. This finding strongly agrees with the statement of Bibi and Ali (2013) who clearly stated that the values of Shannon-Weiner Diversity Index usually falls between 1.5 and 3.5, only rarely it surpasses 4.5. This relative equal and high diversity of bird species at Nguru Lake is an indication of quantitative measure that reflects how many different species are in existence in the sites. This result supports Mengesha and Bekele (2008) who reported that the avian diversity is an indication of habitat heterogeneity and the number of species and individuals in an area implies the importance of the area. Each habitat has a specific set of microenvironment that is suitable for the species.

## CONCLUSION

This study was conducted to investigate the status and diversity of Avifauna species in the study area, the information on the occurrence of birds every month obtained was used for seasonality analysis. However, species identified in dry season was higher compared to the wet season, due to the presence of migrants and Palearctic migrant avifauna species in the study area (dry season) in which this study coincided with the period of their migration in the area. Species diversity attained concentrated in the area, it could be due to the availability, abundance of food in the area. RECOMMENDATIONS In view of the findings of this study, the following recommendations are made:

- i. Effective monitoring and strategies for conservation to restore the declining population of bird species.
- ii. Provide public enlightenment of the people around the wetland on values of Nguru Wetlands.

## ACKNOWLEDGEMENTS

This research work was sponsored by Tertiary Education Trust Fund (TET Fund) as part of the Institution-Based Research (IBR) Intervention.
