

**Editor's Comment:**

The case series discuss about the COVID vaccine-induced immune thrombotic thrombocytopenia. As we are going through the pandemic time and focussing on vaccination for all, publishing an article on the side effects of COVID vaccine requires a strict ethics clearance. From the authors perspective, the ethical clearance has been taken for the larger stroke study, and not specific to this case series. The two reviewers also had asked for the ethical clearance details but has not produced by the reviewers. This has to be considered seriously as the article published in the journal may raise unforeseen issues due to the publication of this study.
