

Editor's Comment:

In the revised paper,

Authors, vaguely placed p value = 0.06 without citing any particular method of statistical method or software utilized.

Also,

If you obtain a p -value = .06, it is not considered significant, therefore you cannot make a claim about the direction of the effect (even though you might have plotted a graph that might suggest there is a positive relationship for example).

You can accept the paper based on these small findings, but the role of beta blockers in acute emergency MI, can not be claimed strongly because it's not proved significantly by any statistical tests. mention the same in the conclusion.
