

Editor's Comment:

The subject of the review is of obvious interest and the experimental design and associated results are worth considering.

Yet, as already underlined by Reviewers, a minimal discussion of these results is necessary. And the conclusion cannot consist only in saying that "using fungicides against this fungal disease is recommended", which, admittedly, is a little bit too short and self-evident.

In fact, there is sufficient material in the overall results to draw a conclusion that more fully reflects the main points highlighted at the end of the experimental part of the study.

After these required improvements are made, the manuscript should be OK for publication in IJECC.
