

**Editor's Comment:**

- reduce the number of figures; in the same figure can put results of several chemical agents
- discuss which of the isolates is from home;
- why they selected only 3 isolates??? discuss
- how did the identification of these isolates occur?
- the bars in the figures refer to standard deviation or statistical difference; both are wrong; review OD values; there is a lot of discrepancy between them; how many repetitions were done?
- disinfectants have color: this interferes with OD data
