Review Form 1.6

PART 1: Review Comments

	Reviewer's comment	Author's comment (if agreed with reviewer, correct the manuscript and highlight that part in the manuscript. It is mandatory that authors should write his/her feedback here)
Compulsory REVISION comments	<p>Abstract: (needs to be revised , the word “ ovarian torsion” is repeated very often)</p> <p>Ovarian torsion is accounting for more than 3% of gynecological emergencies with an Incidence, among all ages of women, of 5.9 per 1,00,000 women. This affection can be simply defined as twisting of the ovary on its ligamentous support, often resulting in impendance of its blood supply, which can lead to ovarian necrosis, infection and peritonitis. Ovarian torsion is mostly associated with presence of benign masses in the ovary, as malignant tumors are less frequent and less prone to undergo ovarian torsion. This is why this complication needs to be diagnosed as early as possible to preserve the function of ovaries and fallopian tubes and to prevent necrosis. Some of the surgical procedures available to untwist the ovary are laparoscopy and laparotomy. If there is prolonged loss of blood flow to the ovary and surrounding tissue then the procedures like oophorectomy and salpingo-oophorectomy are suggested. Some of the medications that can be given for the recovery of patient after surgery are analgesics or opioid analgesics, antibiotics, antifibrinolytics</p> <p>Introduction: Must be revised, there are too many informations not well organized The introduction must follow these steps:</p> <ol style="list-style-type: none">1- Definition2- Causes of the ovarian torsion3- Diagnosis: clinical and ultrasound4- Treatment5- Explain why your case report is important? what does it add to the literature? <p>Case report :</p> <ul style="list-style-type: none">- No abbreviations!!! “ Left IF” ????? “UTI” ????? “POD” ?????- Please revise this paragraph : A female patient of age 19 years was admitted in obstetrics and gynecology ward with the chief complaints of pain in left IF since 1 day on & off, non-radiating, 3 episodes of vomiting's. Patient was apparently normal before 2 days but she started suffering with pain in left iliac fossa which is non radiating type followed by vomiting's. ?????????? (two sentences with the same meaning) <p>- You didn't mention precisely the type of treatment ??? : untwisting the ovary? Or removing the ovary?</p> <p>DISCUSSION: is poor You have to add more valuable scientific researches especially about the prognosis of fertility after surgery (in young women) and the risk of recurrence</p>	<p>Corrections were done as per the suggestions of the reviewer.</p> <p>Sentences were organized according to the steps.</p> <p>Ovarian torsion mainly affects the right side of the ovary. But this is a case of left sided torsion which is rare. So, this will be the useful case report to know information.</p> <p>Abbreviations are written and the paragraph is corrected.</p> <p>It is untwisting the ovary.</p> <p>Information is added as advised.</p>
Minor REVISION comments	Rewrite the title : LEFT OVARIAN TORSION A CASE REPORT	Left ovarian torsion a case report
Optional/General comments
