Review Form 1.6

PART 1: Review Comments

	Reviewer's comment	Author's comment (if agreed with reviewer, correct the manuscript and highlight that part in the manuscript. It is mandatory that authors should write his/her feedback here)
Compulsory REVISION comments	No	
Minor REVISION comments	<p>The comments insert in text of article</p> <p>1. There is need to further state the similarities and or differences of the two study areas in terms of socio-cultural, demographic, geographical as well as socio-economic characteristics.</p> <p>2. There is need to state the sample size determination formular as there is a difference between sampling technique and sample size determination. Also, comparisim study must take into consideration, proportionality factor of the study population in sample size, which in this study in not.</p> <p>3. Please, is a major limitation since it is a comparism study.</p> <p>4. This is a disparity in the sample size earlier state in this report.</p>	<p>1. Sociodemographic characteristics: Bhutan is situated in the eastern Himalayas with a total area of 36 394 sq. km and has a population of 774 830. The country is in the medium human development index (HDI) category. Health services in the country are available through a three-tier structure: (i) basic health units (BHUs), sub-posts and outreach clinics (ORCs) at the primary level; (ii) district or general hospitals at the secondary level; and (iii) regional and national referral hospitals at the tertiary level. At present, there are three referral hospitals, 28 district hospitals including one indigenous hospital at Thimphu, 23 BHUs grade I (BHU-Is), 184 BHUs grade II (BHU-IIs), 28 sub-posts, 562 ORCs and 54 indigenous units.¹²</p> <p>Sri Lanka is a South Asian Island nation in the Indian Ocean and has a population of nearly 21.7 million. The total land area of the country is 65 625 sq.km and includes the main island and several small islands in close proximity to the main land mass. The country is in the high human development index (HDI) category. There are 1,104 curative care hospitals in the government health services. The network of curative institutions is made up of tertiary care institutes as national hospitals, teaching hospitals, provincial general hospitals, secondary care institutes as district general hospitals, base hospitals, and primary care institutes in peripheral units such as divisional hospitals and rural hospitals.¹³</p> <p>2. There are no comparison studies to get the clue. As for our knowledge, this is the first study done on health care support personal. There for Cochran sampling method used with given population in each ministry in each country.</p> <p>3. Yes, I agree with you. But with the pandemic, it was not possible to get random sampling and extremely difficult to collect sample with purposive sample as well.</p> <p>4. The most recent total healthcare support personnel population for the respective countries were collected from reliable sources. For Bhutan, 882 from the Statistical Yearbook of Bhutan - 2019, National Statistics Bureau, Bhutan (page 23) and for Sri Lanka, 58190 from the Sri Lanka Essential Health Service Package 2019 by the Ministry of Health, SL (page 10). The sample size of 268 for Bhutan and 382 for Colombo was generated using the Cochran Sampling technique providing 95% confidence level and a corresponding margin of error of 5.</p> <p>4. Yes agreed. Though sample size for Bhutan is 268, the decision to cover the population of all staff in the three referral hospitals resulted in 392 support staff being included in the study.</p>
