PART 1: Review Comments

	Reviewer's comment	Author's comment (if agreed with reviewer, correct the manuscript and highlight that part in the manuscript. It is mandatory that authors should write his/her feedback here)
Compulsory REVISION comments	The authors' article is a study that evaluates the Quality of Life of menopausal women from Nepal toward a questionnaire. The aim declared in the abstract is different to announced in the Discussion "The main objective of the study was to assess the quality of life of menopausal women and find out the association between reproductive and lifestyle characteristics to quality of life indices"	It has been addressed in discussion section.
Minor REVISION comments	Usually, the Kruskal Wallis and Mann-Whitney U tests are not used to evaluate the association between two variables. Please use the correct test. The authors do not specify the statistical significance considered, and not defined what is "high score" or "low score" Please explain details about how was the random sampling technique, and how obtain the mean score. The discussion deserves to be enriched with more works that evaluate similar variables since the mention of some results is repeated	- Difference in Mean scores of Domains of MENQOL according to Reproductive and Lifestyle Characteristics.Can we write like this as we apply test between categorical and numerical variables where numerical variable was in non-parametric data. -The level of significance was at P<0.05. As per the MENQOL tool higher the score lower will be the quality of life so it was assessed as per the criteria of the given tool and there was no any demarcation line there. -The wards were selected through random sampling by lottery method and ten the samples were selected purposively and it was done on community level. -we have tried to improve as per the feedback.
Optional/General comments
