Review Form 1.6

Journal Name:	Asian Food Science Journal
Manuscript Number:	Ms_AFSJ_84981
Title of the Manuscript:	Effects of temperature and variety on rehydration parameters and solute loss during soaking of maize
Type of the Article	Original Research Article

General guideline for Peer Review process:

This journal's peer review policy states that <u>NO</u> manuscript should be rejected only on the basis of '<u>lack of Novelty'</u>, provided the manuscript is scientifically robust and technically sound. To know the complete guideline for Peer Review process, reviewers are requested to visit this link:

Review Form 1.6

PART 1: Review Comments

	Reviewer's comment	Author's comment (if agreed with reviewer, correct the manuscript and highlight that part in the manuscript. It is mandatory that authors should write his/her feedback here)
Compulsory REVISION comments		morner recondent more)
Compulsory REVISION Comments	General: The standard of English Language is not good. There are several typographical and spelling mistakes. The grammar is some areas are not good.	
	Title : The title must be written again; including the names of the two varieties of maize studied	
	Abstract: The abstract mentions of two mechanisms involved in the uptake of water. But these are neither described both in the abstract and the main paper. This must be addressed. The moisture content of the sundried maize was not provided. This is very important for one to understand the dry matter content and how it influenced the rehydration process.	
	Materials & Methods: The source of analytical reagents used was quoted as being from the Department of Chemistry of the Kwame Nkrumah University of Science and Technology, Kumasi. I am not aware that this university manufactures and sells analytical reagents. The manufacturer of the analytical balance used in the study must be provided. Re: Vitamin C determination. What was the strength of ethanol used? And the concentration of 2,6-dicholorophenol solution used.	
	Results & Discussion: The statements italised: ".	
	i. The increment could possibly be attributed to increased fermentation and hydrolysis of the anti-nutrients due to increased temperature. This is highly speculative and cannot be accepted as such. Which anti-nutrients are being referred to here.	
	ii. The anti-nutrients leached out thereby decreasing their concentrations in the kernels, consequently releasing more P from their initially bound complexes due to their reduced chelating power. This is highly speculative and cannot be accepted as such. What was the basis of this statement??	
	 iii. The temperature serves as a catalyst that helped in the breaking down of the cell wall of the kernels thereby creating large surface area which caused loss of the mineral during soaking. Temperature does not catalyse any reaction of this sort in the cell wall 	
	Conclusion: The following italised statement is not acceptable as part of the conclusion. This is because no work was carried out to study the cell wall of the maize structure. So	
	such a conclusion cannot be accepted. The pores in the maize structure were responsible for the initial rapid water up take by the kernels and the hydration of dry matters constituents such as protein, starch and carbohydrates molecules were responsible for the variation in the rehydration ratio and coefficient of rehydration values of the two varieties	
Minor REVISION comments
