PART 1: Review Comments

	Reviewer's comment	**Author's comment** *(if agreed with reviewer, correct the manuscript and highlight that part in the manuscript. It is mandatory that authors should write his/her feedback here)*
Compulsory REVISION comments		
Minor REVISION comments	Mino revioson This study was a cross sectional survey in which cadavers obtained from the Mortuary unit, Department of anatomy, University of Port Harcourt were used - Does it mean that skeletons participated in a survey or perhaps cadaveric specimen was dissected and parts of the vertebral columnela had been evaluated? - Its very good that ethical approval was granted. The paper is missing any information if the anatomy head even granted the approval for such a study? - Was there any correlation between gender, and specimen estimated age taken onto consideration????? - Are there any key anatomical landmarks and dimensions which are also quite important?	
Optional/General comments	Interesting, but provides basic information Wouldn't in be better to see if age/gender or skeletal lordosis/kyphosis somehow influence on those foramens or not? What was done with the cadaveric remnants after dissection?	

PART 2:

	Reviewer's comment	**Author's comment** *(if agreed with reviewer, correct the manuscript and highlight that part in the manuscript. It is mandatory that authors should write his/her feedback here)*
Are there ethical issues in this manuscript?	(If yes, Kindly please write down the ethical issues here in details)
