PART 1: Review Comments

	Reviewer's comment	Author's comment (if agreed with reviewer, correct the manuscript and highlight that part in the manuscript. It is mandatory that authors should write his/her feedback here)
Compulsory REVISION comments		
Minor REVISION comments	<p>The article is well structured and focused. Design of the study is adequate and well described.</p> <p>Some of the figures need to be verified, eg. page 6 "While twenty-one (5.5%) women felt no pain, 136 (35.8%) and 142 (37.4%) women indicated moderate to severe pain following hysterosalpingography." - The total percent is below 100</p> <p>The main result (page 8 – linear regression) is not detailed – it needs some more information about controlled variables of the procedure (it is supposed that pre-procedure pain level, individual variables as age for instance have been included). This is the key point of the research and have to be better supported.</p> <p>Further research suggested by the author is supposed also to include for instance prolongation and severity of the pain depending on the outcome of the procedure – perceived experience by women, having already idea of the result.</p>	
Optional/General comments	<p>It is suggested some further support – literature review of the numerous and newer articles, eg. Rooney, Kristin & Domar, Alice. (2018). The relationship between stress and infertility. Dialogues in clinical neuroscience. 20. 41-47., describing the stress and anxiety perceived in general in relation to infertility</p> <p>Also, for readers will be interesting to get (in a few sentences) idea about the common situation in Nigeria (average age for first child, average number of children in family). The national context in this way will give readers idea about the social pressure of cultural norms. Currently there is just one sentence in the discussion</p>
